                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      similarity).
SUBUNIT: Binds to TRAF1, TRAF2, and TRAF3, but not TRAF5 and
TRAF6 (By similarity).
SUBCELLULAR LOCATION: Type I membrane protein (isoforms A, B and
C); secreted (isoform D).

CC -!- FUNCTION: Receptor for TNFSF4/OX40L/GP34.

CC -!- SUBUNIT: Interacts with TRAF2, TRAF3 and TRAF5.

CC -!- SUBCELLULAR LOCATION: Type I membrane protein.

"Cloning and characterization of a cDNA encoding the human homolog of tumor necrosis factor receptor-associated factor 5 (TRAFS).";

Gene 207:135-140(1998).

-! FUNCTION: Receptor for the heterotrimeric lymphotoxin containing if And LTB, and for TNFS14/LIGHT. Promotes apoptosis via TRAF3 and TRAF5. May play a role in the development of lymphoid organs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               MEDLINE=98289299; PubMed=9626059;

cell Death Differ. 7:408-410(2000).
-!- FUNCTION: Receptor for TNFSF18. Seems to be involved in interactions between activated T lymphocytes and endothelial cells and in the regulation of T cell receptor-mediated cell death.
Mediated NF-kappa-B activation via the TRAF2/NIK pathway.
-!- SUBUNIT: Binds to TRAF1, TRAF2, and TRAF3, but not TRAF5 and TRAF5.
                                                                                                                                                                                                                   SEQUENCE FROM N.A. (ISOFORM 1), AND INTERACTION WITH TRAF1; TRAF2 AND

PTM: A soluble form (tumor necrosis factor binding protein 2) is produced from the membrane form by proteolytic processing. PHARMACEUTICAL: Available under the name Enbrel (Immunex and Wyeth-Ayerst). Used to treat moderate to servere rheumatoid arthritis (RA). Enbrel consist of the extracellular ligand-binding portinion of TNFR2 linked to an Immuglobulin Fc chain. It binds to TNFR-alpha and blocks its interactions with receptors. SIMILARITY: Contains 4 TNFR-Cys repeats. MEGEOPTO activator of nuclear factor-kappaB ligand and steeptor activator of nuclear factor-kappaB ligand and costeopy acceptor for the pathogenesis and reatment of malignant bone diseases.";

Cancer 92:460-470(2001).

List function in osteoclastogenesis. Inhibits the activation of costeoclasts and promotes osteoclast apoptosis in vitro. Bone homeostasis seems to depend on the local RANKL/OPG ratio. May also play a role in preventing arterial calcification. May act as decoy receptor for TRAIL and protect against apoptosis. TRAIL binding blocks the inhibition of osteoclastogenesis.

C. SUBUNIT: Homodimer.

C. SUBCILITY: Highly expressed in adult lung, heart, kidney, liver, spleen, thymus, prostate, ovary, small intestine, thyroid, lymph node, trachea, adrenal gland, testis, and bone marrow. Detected at very low levels in brain, placenta and skeletal muscle. Highly expressed in fetal kidney, liver and lung.

C. HIGHLY expressed in fetal kidney, liver and lung.

C. HIGHLY holdsylated. Contains sialic acid residues.

C. HIGHLARITY: Contains 2 death domains.

Yamamoto T., Inoue J.-I.;

Yamamoto T., Inoue J.-I.;

ITRAF5, a novel tumor necrosis factor receptor-associated factor

T family protein, mediates CD40 signaling.";

Proc. Natl. Acad. Sci. U.S.A. 93:9437-9442(1996).

- I- FUNCTION: Receptor for TNFSF5/CD40L.

- I- SUBLNIT: Interacts with TRAF3 and TRAF5. Interacts with TRAF1,

TRAF2 AND TRAF6 (By similarity).

C -!- SUBCELLULAR LOCATION: Type I membrane protein (isoforms I, III, IV

and V); secreted (isoform II).

C -!- ALTERNATIVE PRODUCTS:

Event=Alternative splicing; Named isoforms=5;

RGeneration and initial analysis of more than 15,000 full-length
human and mouse cDNA sequences.";
R. "Generation becoy receptor for the cytotoxic ligands TNFS14/LIGHT
C.!- FUNCTION: Decoy receptor for the cytotoxic ligands TNFS14/LIGHT
C.!- SUBCELLULAR LOCATION: Secreted
C.!- TISSUE SPECIFICITY: Detected in fetal lung, brain and liver.
Detected in adult stomach, spinal cord, lymph node, trachea,
spleen, colon and lung. Highly expressed in several primary tumors
from colon, stomach, rectum, esophagus and in SW480 colon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This SWISS-PROT entry is copyright. DEVELOPMENTAL STAGE: Detected in embryo at high levels on day 7, whereas expression decreases at day 11 and increases from day 15 to 17. On day 15 found in developing bone primordia, brachiocephalic artery and ductus arteriosus, left main bronchus, abdominal aorta and midgut.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ω

MO1. Cell 8:169-179(2001).

-!- FUNCTION: Receptor for INFSF14/LIGHT and homotrimeric

TNFSF1/lymphotoxin-alpha. Involved in lymphocyte activation. Plays an important role in HSV pathogenesis because it enhanced the entry of several wildtype HSV strains of both serotypes into CHO cells, and mediated HSV entry into activated human T cells.
-!- SUBUNIT: Interacts with TRAF2, TRAF3 and TRAF5.
-!- SUBCELLULAR LOCATION: Type I membrane protein (Probable).
-!- TISSUE SPECIFICITY: WIDELY EXPRESSED, WITH THE HIGHEST EXPRESSION IN LUNG, SPLEEN, AND THYMUS.
-!- SIMILARITY: Contains 3 TNFR-Cys repeats.
                                                                                                                                                                                                                                                   "Herpesvirus entry mediator, a member of the tumor necrosis factor receptor (TNFR) family, interacts with members of the TNFR-associated factor family and activates the transcription factors NF-kappaB and AP-1."; J. EMBO J. 9:1063-1068(1990).
-!- FUNCTION: Receptor for TNFSF4/OX40L/GP34.
-!- SUBUNIT: Interacts with TRAF2, TRAF3 and TRAF5 (By similarity).
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- TISSUE SPECIFICITY: ACTIVATED T-CELLS.
-!- SIMILARITY: Contains 4 TNFR-Cys repeats.

                                                                                                                                                                                                                                                                                                                                                                                                                                                              INTERACTION WITH SIVA.

INTERACTION WITH SIVA.

TISSUB=Cervical carcinoma, and Thymus;

MEDLINE=97322375; PubMed=9177220;

MEDLINE SIVA;

MEDLINE And binds to Siva, a proapoptotic protein.";

Proc. Natl. Acad. Sci. U.S.A. 94:6346-6351(1997).

MEDLINCTION: Receptor for TNFSF7/CD27L. May play a role in survival of activated T-cells. May play a role in apoptosis through association with SIVA.

MEDLINE: SUBCELLULAR LOCATION: Type I membrane protein.

MEDLINE SPECIFICITY: Found in most I lymphocytes.

MEDLINCARITY: Contains 3 TNFR-Cys repeats.

MEDLIARITY: Contains 3 TNFR-Cys repeats.

MEDLIARITY: Contains 3 TNFR-Cys repeats.

MEDLIARITY: May NOTE=CD guide CD27 entry;

"Gene structure and chromosomal localization of the mouse homologue of rat OX40 protein.";
Eur. J. Immunol. 25:926-930(1995).
-!- FUNCTION: Receptor for TNFSF4/OX40L/GP34.
-!- SUBUNIT: Interacts with TRAF2, TRAF3 and TRAF5 (By similarity).
-!- SUBCELULAR LOCATION: Type I membrane protein.
-!- SIMILARITY: Contains 4 TNFR-Cys repeats.

Koch M., Burgesson R.E., Hunter D.D., Brunken W.J.;

"Laminin expression in adult and developing retinae: evidence of two

RT novel CNS laminins.";

J. Neurosci. 20:6517-6528(2000).

C.: FUNCTION: Binding to cells via a high affinity receptor, laminin is thought to mediate the atrachment, migration and organization of cells into tissues during embryonic development by interacting with other extracellular matrix components.

C.:-FUNCTION: Laminin-15 complex is an heterotrimer composed of three chains (alpha-5/beta-2/gamma-3) which are bound to each other by disulfide bonds into a cross-shaped molecule comprising one long and three short arms with globules at each end.

C.:-SUBCELLULAR LOCATION: Extracellular; found in the basement membranes (major component).

C.:-TISSUE SPECIFICITY: Expressed in heart, lung, kidney, skeletal muscle, pancreas, retina and placenta. Little or no expression in brain and liver.
                                                                                                                                                                                                                                                                                                                                                         brain and liver.

DOMAIN: Domain G is globular and is part of the major cell-binding site located in the long arm of the laminin heterotrimer.

SIMILARITY: Contains 1 laminin N-terminal domain.

SIMILARITY: Contains 22 laminin EGF-like domains.

SIMILARITY: Contains 2 laminin IV domains.

SIMILARITY: Contains 5 laminin G-like domains.

Biophys. Res. Commun. 176:335-342(1991).
-!- FUNCTION: BINDS TO TNF-ALPHA AND BETA. PROBABLY PREVENTS TNF PRACH CELLULAR TARGET AND THEREBY DEAMPENING THE POTENTIAL ANTIVIRAL EFFECTS OF THE CYTOKINE.
-!- SIMILARITY: Contains 4 TNFR-Cys repeats.
                                                                                                                                                                                                                                                                                                                                                                         01-MAY-1992 (Rel. 22, Created)

Heuer J.G., Fatemie-Nainie S., Wheeler E.F., Bothwell M.;
"Structure and developmental expression of the chicken NGF receptor.";
Dev. Biol. 137:287-304(1990).
-!- FUNCTION: Low affinity receptor which can bind to NGF, BDNF, NT-3,
and NT-4. Can mediate cell survival as well as cell death of
neural cells (By similarity).
-!- SUBUNIT: Homodimer; disulfide-linked. Interacts with p75NTR-
associated cell death executor. Interacts with TRAF2, TRAF4,
TRAF6 and PTPN13 (By similarity).
-!- SUBCELLULAR LOCATION: Type I membrane protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CDNCOPGTFCRKY----NPVCKSCPPSTF-SSIGGOPNCNICR-VCAGYFRFKKFCSST

"DNA sequence analysis as a criterion for allocation of the orthopoxviruses to a particular species.";
Submitted (JAN-1998) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Receptor for TNF-alpha and TNF-beta. May contrib the modification of TNF-mediated antiviral processes (By similarity).
-!- SUBCELLULAR LOCATION: Secreted (By similarity).
-!- SIMILARITY: Contains 2 TNFR-Cys repeats.

The crystal structure of a laminin G-like module reveals the molecular basis of alpha-dystroglycan binding to laminins, perlecan, and agrin.";

Mol. Cell 4:783-792(1999).

L. FUNCTION: Binding to cells via a high affinity receptor, laminin is cells into tissues during embryonic development by interacting with other extracellular matrix components.

C. -- SUBUNIT: Laminin is a complex glycoprotein, consisting of three comprising one long and three short arms with globules at each each other by disulfide bonds into a cross-shaped molecule comprising one long and three short arms with globules at each end. The alpha-2 chain is a subunit of laminin-2 (Merosin) and laminin-4 (S-merosin). Interacts with FBLN1, FBLN2 and NID2.

--- SUBCELLULAR LOCATION: Extracellular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DOMAIN: The alpha-helical domains I and II are thought to interact with other laminin chains to form a coiled coil structure. DOMAIN: Domains VI, IV and G are globular. DISEASE: Defects in LAMA2 are a cause of murine muscular dystrophy

Tezak Z., Prandini P., Boscaro M., Marin A., Devaney J., Marino M., Anglain C., Hoffman E.P., Pegoraro E.; Anglain C., Hoffman E.P., Pegoraro E.; Park J., Tygon M., Finkel R., Garcia C., Anglain C., Hoffman E.P., Pegoraro E.; Partial laminin alpha-Z (LAMA2) deficiency."; partial laminin colliscues during embryonic development by interacting of there extracellular matrix components.

1. FUNCTION: Binding to cells via a high affinity receptor, laminin of cells into tissues during embryonic development by interacting with other extracellular alpha, beta, gamma), which are bound to each other by disulfide bonds into a cross-shaped molecule comparising one long and three short arms with globules at each end. The alpha-Z chain is a subunit of laminin-2 (merosin) and laminin-4 (S-merosin).

1. SUBCELLULAR LOCATION: Extracellular; found in the basement membranes (major component).

2. SUBCELLULAR LOCATION: Extracellular; found in the basement membranes (major component).

3. TISSUE SPECIFICITY: Placenta, striated muscle, peripheral nerve, sxin, testis, meninges, chorid plexus, and some other regions of the brain, not in liver, thymus and bone.

3. TISSUE DEFICIENT TO and Gameins I and in are thought to interact with other laminin chains to form a coiled coil structure.

3. DOMAIN: The alpha-helical domains I and white matter hypodensity on MRI.

4. DISBABS: Defects in LAMA2 are the cause of merosin-deficient congenital muscular dystrophy type 1A (Molecular Process), hyporeflexia, and wind walter hypodensity on MRI.

5. SIMILARITY: Contains I mainin Wellen and commined to main the domains.

5. SIMILARITY: Contains I mainin Meromine.

"Functional interaction of Fas-associated phosphatase-1 (FAP-1) with
FDTS (NTR) and their effect on NF-kappaB activation.";
FEBS Lett. 460:191-198(1999).
-!- FUNCTION: Low affinity receptor which can bind to NGF, BDNF, NT-3
and NT-4. Can mediate cell survival as well as cell death of
neural cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               EMBL; M14764; AABS9544.1; -.

alternative polyadenylation sites.";

Gene 133:307-308(1993).

-! FUNCTION: INTEGRIN ALPHA-V/BETA-S IS A RECEPTOR FOR FIBRONECTIN.

IT RECOGNIZES THE SEQUENCE R-G-D IT ITS LIGAND.

-!- SUBUNIT: HETERODIMER OF AN ALPHA AND A BETA SUBUNIT. BETA-5

ASSOCIATES WITH ALPHA-V.

-!- SUBCELLULAR LOCATION: Type I membrane protein.

-!- PTM: The cysteine residues are involved in intrachain disulfide

"Cowpox virus contains two copies of an early gene encoding a soluble secreted form of the type II TNF receptor.";
virology 204:343-356(1994).
-!- FUNCTION: Receptor for TNF-alpha and TNF-beta. May contribute to the modification of TNF-mediated antiviral processes.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SIMILARITY: Contains 2 TNFR-Cys repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      STRAIN=GRI-90 / Grishak;

Submitted (JAN-1998) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Receptor for TNFSF6/FASL. The adaptor molecule FADD recruits caspase-8 to the activated receptor. The resulting death-inducing signaling complex (DISC) performs caspase-8 proteolytic activation which initiates the subsequent cascade of caspases:

(aspartate-specific cysteine proteases) mediating apoptosis. FAS-mediated apoptosis may have a role in the induction of peripheral tolerance, in the antigen-stimulated suicide of mature T-cells, or both (By similarity).

-!- SUBUNIT: Binds DAXX and RIPKI (By similarity).

-!- SUBCELLULAR LOCATION: Type I membrane protein.

-!- DOMAIN: CONTAINS A DEATH DOMAIN INVOLVED IN THE BINDING OF FADD, AND MAYBE TO OTHER CYTOSOLIC ADAPTOR PROTEINS.

-!- SIMILARITY: Contains 3 TNFR-Cys repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This SWISS-PROT entry is copyright.
